

# **ipachrome** design

The innovative solution  
for decorative façade glazing

ipachrome design is the innovative solution for glazing façades in a more decorative way; in the form of surface mirrors made from high-quality float glass it is not only shatter-proof and impact-proof (like safety glass) but also - being suitable for some forms of coating - opens up completely new possibilities for the design architect. ipachrome design - for creative glazing that adds visual value.

### Variety in use and design

Whether for interior or exterior applications, as façade cladding or in the construction of shop interiors or exhibition stands, for company logos, texts, or free-standing sign posts, to draw fine lines or to cover whole surfaces, ipachrome design - suitable for some additional functional coatings - gives your unique design ideas the freedom they need.

ipachrome design turns glazing into an visually attractive design component in its own right with a high eye-catching value and without any compromise in terms of function.

### Strength, reliability, flexibility

ipachrome design from INTERPANE is a chromium-based multiple layered coating system. ipachrome design - with a transmission coefficient of only 4% - is as highly reflective as a conventional silver mirror but substantially stronger and more resilient and perfectly capable of surviving in environments with high atmospheric humidity.

ipachrome design can be heat strengthened for use in safety glass and laminated safety glass and it can, combined with iplus thermal insulation or with ipasol, be further processed, two double glass units providing thermal insulating.
